NAME
cloudprint – share CUPS printers with Google Cloud Print

SYNOPSIS
cloudprint [*OPTION*]...

DESCRIPTION
The **cloudprint** script makes locally defined CUPS printers available to a Google account, enabling local or remote printing from such services as the Chrome browser, Chrome OS devices, or Android devices.

This is a lower-level command. Cloud Print services would normally be managed through the cloudprint service.

OPTIONS
–l   log out of the Google account. This deletes the account identification file, requiring reauthentication the next time cloudprint is run.

–a *<account_file>*
> path to Google account ident data (default ˜/.cloudprintauth). The format of the file is not public.

–c   establish credentials to the service, then exit.

–h   display help

cloudprint will prompt for a username and password if the information has not been provided.

If two-factor authentication is enabled for the account, then an application-specific password must be used.

FILES
˜/.cloudprintauth
> Default location for storing account authentication credentials

˜/.cloudprintauth.sasl
> Default location for storing internal authentication tokens
